

Automatic Inspection Systems

Rapid Customisation

- Industry proven leading edge solutions
- Dedicated team of focused engineers
- On-line systems installed and earning their keep
- Integration and optimisation of “standard” products when viable
- Solutions to “impossible” problems

York Electronics Centre provides customised solutions for vision inspection applications. Our team of dedicated engineers combines custom elements with configured standard industry available building blocks to provide very rapid optimised solutions for those seemingly impossible problems. With the added benefit of being linked to York University when the application requires a greater range of disciplines it is possible to establish a multifunctional team to address the problem in a quick, efficient and pragmatic manner.

The team is well experienced in providing turnkey solutions for a wide range of customers with applications ranging from food handling systems to metal component inspection.

It is almost certain that improving your inspection systems can increase your sales and profits. Involving experts in this field is the best way to determine just what can be achieved. In the early stages of an investigation YEC can carry out a very low cost feasibility study thus limiting the initial expenditure when productivity gains are not fully defined.

Please contact Graham Long at York Electronics Centre so that we can study the details of your requirements.
